Creating the few-shot example set

PromptTemplate and ChatPromptTemplate are great for integrating variables, but struggle with integrating datasets containing many examples. This is where FewShotPromptTemplate comes in! In this exercise, you'll create a dataset, in the form of a list of dictionaries, to contain the follow question-answer pairs.

- Question: How many DataCamp courses has Jack completed?

- Answer: 36

- Question: How much XP does Jack have on DataCamp?

- Answer: 284,320XP

- Question: What technology does Jack learn about most on DataCamp?

- Answer: Python

In the next exercise, you'll convert this information into a few-shot prompt template.

Instructions

100 XP

- Create a list of dictionaries for the questions and answers provided, using the keys "question" and "answer".

script.py

```python
# Create the examples list of dicts
examples = [
 {
   "question": "How many DataCamp courses has Jack completed?",
   "answer": "36"
 },
 {
   "question": "How much XP does Jack have on DataCamp?",
   "answer": "284,320XP"
 },
 {
   "question": "What technology does Jack learn about most on DataCamp?",
   "answer": "Python"
```

```
  }
]
```
